

Creating a CF2 file from a stepped EPS file

For an EPS file that contains stepping information, define the die line for one item, then find all matching die stations.

To create a CF2 file from a stepped EPS file:

1. Open the file in CAD Correct.
For more information about opening files, see [Opening Files](#).
If the lines do not display as **Cut** in the **Show Line Type** list, change all lines to cut lines.
2. Define each individual item or shape in the layout.
For information about defining an individual item, see [Defining an item](#).
3. Save a CF2 file for use in Pandora software.
For information about saving files, see [Saving a file](#).
