

Adding marks

You can add any mark on the **Marks** palette to a job. A variety of marks is available in the software. You can also add your own marks.

1. If the **Marks** palette is not currently shown, select **Window > Show Marks Palette**.
2. If you want to automatically bind a mark to a specific die station in the layout, select the die station. Otherwise, clear any selections in the layout.
3. In the list on the **Marks** palette, select the appropriate folder to open it, and select the mark. (There may be a short delay while the mark is RIPed for preview.)
4. Drag the mark or folder that contains a set of marks to the desired location in the layout. If the mark is part of SmartMarks, it automatically positions itself.

Tip: You can also click the options arrow on the **Marks** palette, select **Add to Job**, and drag the mark into position.

The mark name appears in the **Marks** folder on the **Content** tab in **job properties**.

Note: You can hide marks by selecting **View > Hide Marks**.
