

Output Color Attributes

In **job properties**, the **Output Color Attributes** area of the **Content** tab lets you define which separations of a mark will print and which separations will reverse, and adjust the tint % of the mark.

The color separations displayed in the Output Color Attributes table are drawn from the color separations of all placed artwork in the job. In Pandora integrated with Prinergy Workflow, the color separations displayed in the Output Color Attributes table also include color separations in all placed marks. Importing a mark or artwork into a job does not add its color separations to the table. You must place the artwork or mark on the layout.

If the job contains more than 32 colors, the Pandora software will not preview registration marks added to the job.
